

The companion digest to the casebook: cases of capability under stress — how it fails, how it has been engineered, and where the discipline is being tested next.

Each entry distills a case to its essentials — title, a brief callout, one to three key references, and the LENS courses it informs — with the full three-page treatment in the main casebook. A companion to the Learning Design and Technology program and the Learning Engineering for Next-Generation Systems specialization at the Johns Hopkins University School of Education.
